Child Support Gains Some Ground
by Elaine Sorensen

Significantly more children in low-income families received child support in 2001 than in 1996. Half of all children with family incomes below the federal poverty thresholds lived with their mothers and had fathers living elsewhere in 2001, making them potentially eligible to receive child support. Thirty-six percent of those children actually did receive support that year, up from 31 percent in 1996. Support for children in families with incomes between 100 and 200 percent of the federal poverty thresholds also increased. These gains suggest that efforts to improve the child support program have met with some success.1

States administer the federal child support program, which aims to ensure that parents who live apart from their children provide for them financially. All families with children who have a parent living elsewhere are eligible for its services. The program tends to serve low-income families, in part because most public assistance programs require recipients to participate in government child support collection efforts. Higher-income families tend to hire attorneys rather than requesting assistance from the government when they need child support services.

Congress views the child support program as a key element of the government’s social safety net. In 1996, Congress enacted significant reforms of the program as part of its sweeping reform of welfare. Specifically, it increased the use of wage withholding to collect child support by mandating that employers report all newly hired employees to the child support program. It also allowed states to revoke driving licenses, professional licenses, and recreational licenses of parents who fall behind in their child support.2 This Snapshot uses data from the 1997 and 2002 National Survey of America’s Families to examine whether child support has increased since the passage of welfare reform.

Child Support Increased, Mainly in Low-Income Families

More children who lived with their mothers and whose fathers lived elsewhere received child support in 2001 than in 1996 (table 1). Gains were greatest for children in families with low incomes. For example, 35.5 percent of children whose family incomes fell below the federal poverty thresholds received child support in 2001, up from 30.8 percent in 1996, a statistically significant gain. Significant gains in child support were also made among children with family incomes between 100 and 200 percent of the poverty thresholds: 50.1 percent received child support in 2001, up from 44.6 percent in 1996. Children whose family incomes were more than twice the poverty threshold did not experience significant gains in child support.

Families with child support income did not experience significant gains in the amount of that support (table 1). After adjusting for inflation, the average amount of child support received in 2001 was $4,650, compared with $4,390 in 1996. On average, poor families received $2,550 per year in 2001 (about 18 percent of the federal poverty threshold for a family of three), an amount that is not significantly greater than what they received in 1996. Among poor families receiving some support, child support represented 30.0 percent of total income in 2001.

Discussion

While these gains are good news for low-income families, the child support program needs to do more. Over 60 percent of poor children who live with their mothers and whose fathers live outside the home do not receive child support. One reason is that the fathers of these children tend to have low incomes themselves,
limiting their ability to pay child support (Sorensen and Zibman 2001). Work-oriented programs designed to ensure that fathers are doing what they can to support their children financially could be beneficial (Miller and Knox 2001).

Another reason that child support receipt is low among poor families is that nearly all of the support paid on behalf of children receiving public assistance goes to the government rather than to the children. In 1996, Congress eliminated the requirement that the first $50 of child support go directly to families on public aid. While some states have retained the $50 child support pass-through, most have not. Eliminating the pass-through has not only reduced the amount of child support received by poor families, it has also reduced the incentive of fathers to pay child support (Meyer and Cancian 2002).
